

Introduction

Html2Pdf is a module based on [iText7](#) core that allows you to transform html and accompanying css into a pdf-document

Html2Pdf aims to support the majority of html tags and css declarations, allowing you to create beautiful pdf documents without having to learn a new skillset.

Default output

Below are some examples of the output of Html2Pdf when no Css is specified

A paragraph containing a span tag, a *emphasized tag*, a **bold tag**, a `code tag`, a *cite tag*, a ~~s-tag~~, a **strong tag** and a u tag and a variable with both super and subscript: x_i^j .

A Simple table

Header 0		Header 1	
Data		Data	
Data		data	

An image

Some lists

1. item
2. item
3. item

- item
- item
- item

Css applied

And some examples using the css found in [Blogpost.css](#)

A Simple table

Header 0	Header 1
Data	Data
Data	data

An image

Some lists

- I. item
- II. item
- III. item

- item
